PGR-6300 DEVICENET INTERFACE

MAY 20, 2009

REVISION 1

QUICK SETUP

- Use the OPI to access the *Setup* | *Hardware* | *Network Comms* menu. Set the *Network ID* for the device. Set the *Baud Rate* as *DN 125K, DN 250K*, or *DN 500K*. Select the DeviceNet producing assembly (input) from the *DeviceNet Produce* menu and the DeviceNet consuming assembly (output) from the *DeviceNet Consume* menu. Select *DeviceNet* from the *Network Type* menu. The assembly types can also be set using parameter 472 and 473 via configuration software.

- Configure the scanner's polled connections for the selected assembly sizes. The scanner may issue a configuration warning if an I/O size other than the default is used. Disregard the warning.

1. GENERAL

This document describes the DeviceNet features supported by the PGR-6300. The PGR-6300 supports Explicit and Polled I/O. It does not support the Unconnected Message Manager (UCMM).

The PGR-6300 requires supply voltage connected to L1 and L2 to power the control unit and 24-Vdc supply voltage to power the isolated DeviceNet transceiver circuit. The DeviceNet transceiver circuit requires 70 mA @ 24-Vdc from the DeviceNet power supply.

2. DEVICENET INTERFACE

2.1 Network Settings

DeviceNet settings are located in the *Setup* | *Hardware* | *Network Comms* menu. Prior to making changes to network settings via the OPI, it is recommended to set the *Network Type* to *None*. Set *Network ID* to the slave number. Set the *Baud Rate* to *DN 125K*, *DN 250K* or *DN 500K*. Select the producing assembly instance using the *DeviceNet Produce* menu and the consuming assembly instance using the *DeviceNet Consume* menu. See Section 3.5 for assembly details. Once the changes have been made, select *DeviceNet* from the *Network Type* menu.

2.2 Product Manual Notes

Appendix E, Register 383: Baud rate selections (Type T17 in Appendix F) includes DeviceNet selections5:125 kb, 6:250 kb, and 7: 500 kb.

Appendix E, Register 385: Network ID range is 0 to 63. Values greater than 63 will be forced to 63.

2.3 Communication Status Display

The DeviceNet communication status can be viewed using the *Metering* | *Comm State* menu.

This menu indicates the connection state as ONLINE or OFFLINE. The last communication error is also displayed. The PGR-6300 can be programmed to trip if the connection is OFFLINE. The PGR-6300 is OFFLINE when there are no connections established and ONLINE when at least one connection is established.

2.4 DeviceNet LED Indication

Two LEDs labeled MODULE STATUS (MS) and NETWORK STATUS (NS) are located on the left side of the control unit as shown in Fig. 1. The MS LED is green when the DeviceNet driver is operational. If this LED is off, verify that *DeviceNet* is selected from the *Setup* | *Hardware* | *Network Comms* | *Network Type* menu.

The NS LED is off when the PGR-6300 is the only device on the network. It flashes green when the PGR-6300 is physically connected to a network containing other devices but has no established communication connections. It is solid green when a Polling or Explicit Messaging connection is established. It flashes red when one or more connections have timed out. It is solid red if a Duplicate MAC ID or Bus-off error has occurred. Red LED indication requires a restart of the DeviceNet driver. This is done by, unplugging and re-connecting the DeviceNet connector, cycling supply voltage or by using the *Setup* | *Hardware* | *Network Comms* | *Network Type* menu. Select *None* to shut down the driver and then select *DeviceNet* to restart.

2.5 Network Errors

The PGR-6300 can be configured to trip or alarm on a network error using the *Setup* | *Hardware* | *Network Comms* | *Network Error* menu, or by using attribute 0x64 of the DeviceNet object.

The Network Error set point sets the action to be taken when the module is off line. Selections are Trip, Alarm, Trip and Alarm, or No Trip or Alarm. Network errors can originate from network watchdog timeouts or the network hardware in the PGR-6300.

The last error code is displayed in the *Metering* | *Comm State* menu. The error codes are listed in the following table.

DeviceNet Error Codes

ERROR	DESCRIPTION
1	Receive Overrun
2	Transmit Overrun
3	CAN Overrun
4	IO Send
5	Duplicate MAC
6	Bus Sense
7	MAC Was Set
8	ID Reset 0
9	ID Reset 1
10	Bus Off
11	CAN ESET
12	CAN ERESET
13	Explicit Timeout
14	IO Timeout
15	IO Delete
16	No CAN Interface

2.6 Configuration Using RSNetWorx

Use the EDS Wizard to register the eds file. The device will register as a Motor Starter named PGR-6300. Select device properties to view Device Parameters. When there is a request to upload from device, select this option. This will load the present configuration from the PGR-6300.

5	54 (0x36)	Extended Motor Starter 2 (Default)	1	62 33 36

(1) Requires configuration of the User Defined Registers defined by parameters 451 to 466 and set via RSNetWorx or the User Registers menu. SIZE IS FIXED AT 32 BYTES. See Assembly Class 4, Instance 0x67, Attribute 3.

The following static output instance are supported and can be selected by setting parameter 472 to the desired ID:

CONSUMING ASSEMBLY ID	INSTANCE (1)	DESCRIPTION	DATA SIZE IN BYTES	SYMBOLIC IO CONNECTION PATH
1	2 (0x02)	Basic Overload	1	62 30 32
2	3 (0x03)	Basic Motor Starter	1	62 30 33
3	4 (0x04)	Extended Contactor	1	62 30 34
4	5 (0x05)	Extended Motor Starter	1	62 30 35

(1) Default is None.

Assemblies are configured using attributes 0x64 and 0x65 of Class 5, or selected by setting the Produced and Consumed connection path attribute in the Polled I/O connection instance. Setting the path to empty (no data), will disable production or consumption and the corresponding connection size will be zero.

Assemblies are accessed using Polled I/O or can be read using Explicit Messaging. For explicit messaging, the Class is 4, the Attribute is 3, and the Instance is the assembly instance number.

Assembly Class (4), Instance (0x65), Attribute (3) – Input

Produced Connection Path = "62 36 35"

Assembly definition is the same as Byte 0 to 131 of Assembly Instance 0x64. Use this for applications where RTD temperature protection is not used.

Assembly Class (4), Instance (0x66), Attribute (3) – Input

Produced Connection Path = "62 36 36"

Assembly definition is the same as Bytes 0 to 5 of Assembly Instance 0x64. Use this assembly if network traffic must be minimized.

Assembly Class (4), Instance (0x67), Attribute (3)

Produced Connection Path = "62 36 37"

This assembly is used to access any combination of sixteen user-defined registers. Assembly size is fixed at 32 bytes. User defined registers are programmed using the *Setup* | *Hardware* | *Network Comms* | *User Registers* menu, or by explicit messaging to Class 0x6A via the configuration tool. Register values are defined in Appendix E of the PGR-6300 manual. Each comm register in Appendix E defines a 16-bit value. For 32-bit float type (DeviceNet REAL), only the first register of the pair needs too be entered. For example, to configure an assembly to read the first four RTD temperatures in RTD Module 1, enter register numbers 902, 904, 906, 908 in sequence. The first 16 bytes of the assembly will contain the RTD data and the other 16 bytes do not contain any valid data. Register definitions resulting in more than 32 bytes of data will be ignored.

Scanner byte size must be set to 32 bytes in all cases.

Overload/Starter Instances

Instances 2 to 5 and 0x32 to 0x36 are assemblies containing attribute values from the Control Supervisor.

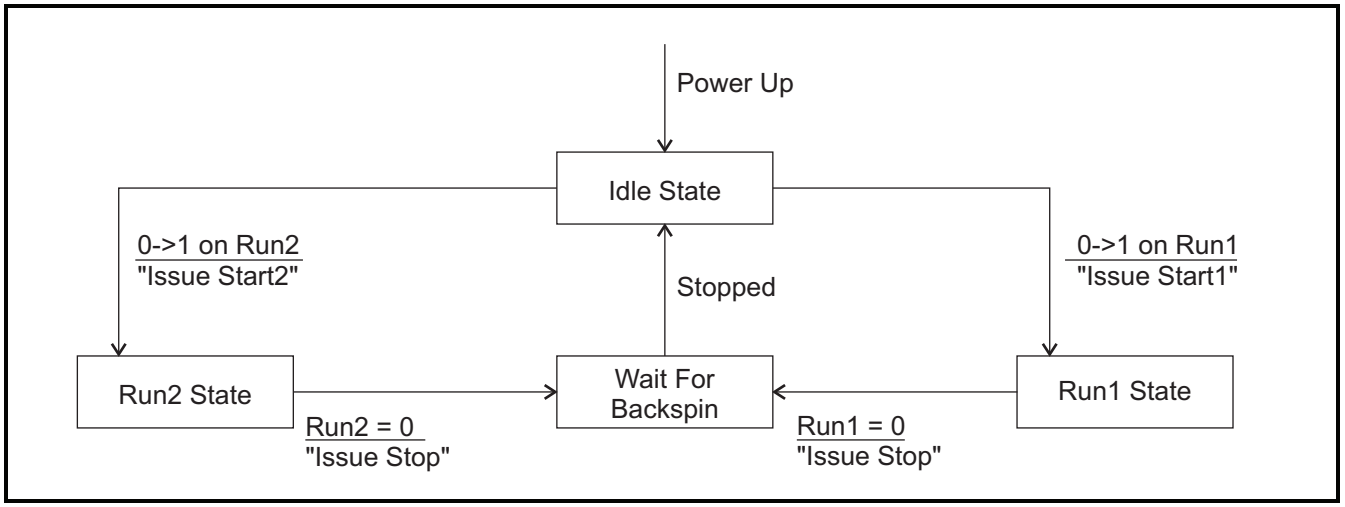
3.6 Control Supervisor Object

State Transition Diagram

Start/Stop control can be performed using the control supervisor class attributes. The control supervisor issues commands to the PGR-6300 as shown in the state diagram.



Notes:

- Commands issued are only processed if the CtrlFromNet (Attribute 15) is 1. For this bit to be set, the following conditions must be met:

1) A starter type must be selected (Attribute 0x73).

2) PGR-6300 must be in REMOTE CONTROL - Default setting.
3) Network control must be in the remote group (Attribute 0x72) - Default setting.

- The starter-sequence state is given by Attribute 0x92.
- The user is responsible for setting Run1 and Run2 bits (Attributes 3 & 4) to zero when a stop or trip condition occurs.

RTD Module Object Instance Services

Get_Attribute_Single: Returns contents of specified attribute.
Set_Attribute_Single: Modifies specified attribute.

Object Instance Attributes 1 to 8 define the RTD type. Selecting an RTD will enable trip and alarm set points. The trip action is fixed as Trip1 and the alarm action is fixed as Alarm1.

0 = RTD Disabled
1 = Platinum 100 ohm
2 = Nickel 100 ohm
3 = Nickel 120 ohm
4 = Copper 10 ohm

Object Instance Attributes 0x09 to 0x10 define the RTD function.

0 = Stator
1 = Bearing
2 = Load
3 = Ambient

Object Instance Attributes 0x11 to 0x20 define the trip and alarm settings in degrees C. The trip action is fixed as Trip1 and the alarm action is fixed as Alarm1.

Object Instance Attributes 0x21 to 0x28 define an 18-character name.

Object Instance Attributes 0x29 to 0x30 are temperature readings.

Object Instance Attributes 0x31 to 0x38 are the trip counters for each of the RTD's.

3.14 Comm Register Class 0x6A

This object defines the communication registers that generate the data for Assembly Class 4, Instance 0x67, Attribute 3. Register values are defined in Appendix E of the Main Product Manual. Each register in Appendix E defines a 16-bit value. For 32-bit float type (DeviceNet REAL), only the first register of the pair needs too be entered. For example, to configure an assembly to read the first four RTD temperatures in RTD Module 1, enter register numbers 902, 904, 906, 908. The first 16 bytes of the assembly will contain the RTD data and the other 16 bytes do not contain any valid data. Register definitions resulting in more than 32 bytes of data will be ignored.
